Linear Approximation

Section 13.4

B.H.

Suppose f is a function of (x, y) and both f_x and f_y are continuous.

$$\Delta z = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0)$$

Linear Approximation

Linear Approximation

Section 13.4

B.H.

Note that $\varepsilon_1, \varepsilon_2 \rightarrow 0$ as $(\Delta x, \Delta y) \rightarrow (0, 0)$. Consequently,

$$\Delta z = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \varepsilon_1\Delta x + \varepsilon_2\Delta y,$$

where $\varepsilon_1\Delta x + \varepsilon_2\Delta y$ decays in a comparable order of $\|\Delta x\mathbf{i} + \Delta y\mathbf{j}\|^2$.
